ABSTRACT OF THE DISCLOSURE

A suture anchor includes a placement portion frangably connected to an

attachment portion. The attachment portion includes an outwardly projecting barb.

During insertion of the suture anchor within a bore hole formed on a bone, the barb

scores at least a portion of the bone bounding the bore hole. Once the suture anchor is

disposed within the bore hole, a withdrawal force is applied to the suture anchor such

that the attachment portion thereof rotates within the bore hole and disconnects from the

placement portion. In an alternative embodiment, the suture anchor can be formed

without the outwardly projecting barb.
